

4. Quality of the examination:			
<input type="checkbox"/> Poor	<input type="checkbox"/> Average	<input checked="" type="checkbox"/> Good	<input type="checkbox"/> Excellent

5. Conclusion of the examination:	
<input checked="" type="checkbox"/> Normal :	No evidence of hypertrophic cardiomyopathy.
<input type="checkbox"/> Equivocal:	Hypertrophic cardiomyopathy can be neither confirmed nor ruled out.
<input type="checkbox"/> Abnormal:	<input type="checkbox"/> Hypertrophic cardiomyopathy of primary or secondary cause was detected during the examination. <input type="checkbox"/> Another cardiac abnormality was detected during the examination.

add mitral regurgitation not clinically significant. Not hereditary

Recommendation:

- We recommend repeating the echocardiogram in a year to continue to confirm the absence of feline hypertrophic cardiomyopathy in this patient. Despite the absence of this pathology today, the disease could still develop in the future. There is no contraindication to the breeding of this animal at this time.
- Hypertrophic cardiomyopathy can be neither confirmed nor ruled out. We recommend a complete cardiac investigation. Hypertrophic cardiomyopathy can possibly be transmitted to the offspring.
- We recommend a complete cardiac investigation due to the presence of hypertrophic cardiomyopathy or other cardiac abnormality. Reproduction of this animal is not recommended.

Certification:

I certify that I examined Gracie and that my findings are adequately represented on this document.
